Credit Name: CSE2130
Assignment Name: Word Guess

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem
How did you approach understanding the challenge?
Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?
I didn't encounter any major challenges while making this program, but I ran into some issues while updating the word, and iterating through the file, but those were just solved with the correct syntax and minor logic changes.

Planning the Solution
Did you create a plan or break the problem into smaller steps before coding? How did you decide on the tools, data structures, or algorithms to use?
I chose to divide it into reading the file, iterating through the word, and then how the program would output and input text.

Implementation
Did you write the code in small pieces or attempt the entire solution at once? How did you test your solution along the way to make sure it was working?
I did the program in 3 main parts, each having their own components. I started by getting the program to properly select a random word from the file, before moving on to the word being output to the user with dashes. After that I moved onto how the user would interact with the program and make their guesses while updating the number of guesses that they've used.

Overcoming Challenges
What part of the problem was the most difficult for you? How did you handle moments when you felt stuck or unsure of what to do next?
The hardest part was figuring out how to go through each character in the word when updated or checking guesses.

Learning
Was there anything you learned that you think will help you with future challenges?
This programmed taught me more about how to go through each line in the file and each character in a string.
